

Vacuum Producers

The vacuum producer is the heart of the system. Here the negative pressure is created that drives the system.

About Vacuum Producers

The heart of the system

The vacuum producer is the heart of the system. Here, the negative pressure is created that drives the system. In Dustcontrol extraction systems, the vacuum level is generally from 6–40 kPa.

Our normal source extraction and vacuum cleaning systems use turbopumps. This device has an ideally suited characteristic capacity for this type of system. Vacuum level increases as more resistance is presented, an important quality in minimising the possibility of blockages in the tubing system. For applications involving fume and light dust, such as paper, radial blowers are used. These have larger air-flows and operate at a lower, relatively constant vacuum level. Our turbopumps and radial blowers have very high quality silencing, see technical specifications.

Turbopumps

Dustcontrol's turbopumps are regenerative blowers, both the direct and belt driven models. As the impeller rotates, centrifugal force moves the air from the root of the blade to the tip. Leaving the tip, air flows around the contour of the housing and is picked up at the root of the succeeding blade. The "closed" area of the housing between the outlet and inlet, forces the air to atmosphere. The many blades on the impeller create increasing stages of pressure generation and result in a very stable pressure differential capability. This pressure generation causes

heat to be generated naturally which dissipates in the air flow and through the blower housing. Noise reduction, particularly on the larger units is very effective. When two or more units are installed in parallel, they can be operated on demand for maximum efficiency and minimum energy consumption.

Radial Blowers

Dustcontrol fans are radial blowers, air is introduced at the center of the fan wheel and forced outward with centrifugal force toward the fan housing. These fans can be operated fully restricted in a "free-wheeling" condition without adverse effect and can therefore be operated without vacuum relief valves. The fans are designed for pressure and are overloading type units. They cannot be operated without being connected to the restriction of a tubing system. Operation above their maximum rated flow will result in overloading and the motor protection will trip out. To limit the power surge at start-up, install a shutter valve on the inlet which should be closed when the fan starts.

Dustcontrol's radial fans meet the ErP directive 2009/125/EC. The ErP, Energy related products, directive 2009/125/EC aims to lower the energy consumption for fans. Commission Regulation (EU) No 327/2011 states how to implement this directive. The efficiency requirements affect Dustcontrol's RAF-range.

The capacity curves for Dustcontrol vacuum producers have been measured and are stated empirically. Outlet pressure losses from a normal outlet (silencer, back-flow valve/bend) have been accounted for in the curve. Additional equipment such as a diffuser can result in increased pressure loss and must be taken into consideration. Stated air-flows are for standard air (101.3 kPa @ 20° C).

The stated curves are for negative application, all pressures stated are assumed to be below relative atmospheric pressure at sea level. These devices can also be used for positive pressure application and will generate a greater pressure differential.

Turbopumps Direct driven

TLD/TED 30/36

3-phase

Turbopumps TLD 30/36 and TED 30/36 are direct driven single stage units. To ensure constant pressure and that cooling air is available to the pump when all outlets are closed, the tubing system should be equipped with a vacuum relief valve.

TPD 30/36

Turbopump TPD 30/36 is a direct driven twin impeller parallel series connected unit. To ensure constant pressure and that cooling air is available to the pump when all outlets are closed, the tubing system should be equipped with a vacuum relief valve.

TSD 30/36

Turbopumps TSD 30/36 is a direct driven twin impeller series connected unit. This is used in demanding applications where high vacuum levels are required. To ensure that cooling air is available to the pump when all outlets are closed, the turbopump can be equipped with a cooling air inlet.

Service Tip

These direct driven units are extremely reliable and have low service requirements. Always change the O-ring when repcsing the outboard bearing in the TSD and TPD pump. Also change the thermoprotector if there is one installed.

400 g Grease Cartridge for Dustcontrol Turbopumps, Part no 9928.

Turbopumps Direct driven

Accessories (Part No)

3037 Bracket 500 mm (2 req'd)
For wall installation of TLD 30/36.

3195 Silencer 80300/180
Used for silencing of 50 mm vacuum valve.

4477 Pump Chassis
For separate mounting of TED 30/36, TPD 30/36 and TSD 30/36.

4942 Silencer 100 300/200
Used for silencing of 76 mm vacuum valve and also exhaust silencing on 2.2–11 kW/4–15 hp turbopump. For accompanying tubing details, see installation example.

8253 Vacuum Relief Valve 50 mm
Used with TLD 30/36. The vacuum relief valve is installed on the tubing system (inlet side) on a branch tube. This delivers cooling air to the turbopump and can be adjusted for the desired vacuum level in the system.

8001 Vacuum Relief Valve 76 mm
Used with TED 30/36 and TPD 30/36. The vacuum relief valve is installed on the tubing system (inlet side) on a branch tube. This delivers cooling air to the turbopump and can be adjusted for the desired vacuum level in the system.

40595 Cooling air inlet with silencer for TSD 30/36
Cooling air is introduced to the turbopump between stages so the unit can be driven with all outlets closed without the risk of overheating.

42297 Back Flow Valve Ø108
Installed on the inlet side of the turbopump when two or more units are parallel installed.

Silencing Covers. The silencing covers will reduce the sound level by 4 dB.

Turbopumps Belt driven

TPR

Turbopumps with TPR designation are parallel connected twin impeller belt driven units. Cooling air is introduced into the unit through an adjustable vacuum relief valve. The vacuum pressure in the system can be held constant when different outlets are opened. The turbopumps are equipped with thermal overload protection on the outboard bearing which will trip out when bearing temperature becomes excessive. A back flow valve is built into the unit on the inlet side.

TSR

Turbopumps with TSR designation are series connected two stage belt driven units. Cooling air is introduced into the pump through a slot between the two stages.

In this way the second stage cools the first stage indirectly, allowing the pump to run at extremely high vacuum and low airflow without overheating. The turbopumps are equipped with thermal overload protection on the outboard bearing which will trip out when bearing temperature becomes excessive.

A back flow valve must be additionally installed on the inlet side of the unit when several units are to be installed in parallel.

RAF 500

RAF 500S

3-phase

The RAF 500 is ideal for small fume extraction systems, for example with Flexpipes. Spiral tubing is generally used. The blower is a direct driven unit with minimal service requirements. (Lubrication interval 10000 hours.)

The RAF 500S is for application in extraction systems with lighter dust, e.g: wood dust. It is a twin wheel, series connected unit. The unit is direct drive and has minimal service requirements. (Lubrication interval 10000 hours.)

Radial blowers

RAF 2501

The RAF 2501 is applied in extraction systems requiring large air-flows for lighter types of dust and cleaning. Pressure generation is achieved through two series connected stages. The unit is equipped with vibration isolation and a silenced enclosure. The unit should always be equipped with an exhaust silencer.

The unit is direct driven and has minimal service requirements (lubrication interval 10000 hours).

V	Hz	Motor	Part No
400	50	30 kW	112200
230	50	30 kW	112202
460 USA/CAN	60	40 hp	112204

RAF 2502

The RAF 2502 is applied in extraction systems requiring large air-flows such as systems for fume extraction. RAF 2502 work with two parallel impellers. The unit is equipped with vibration isolation and a silenced enclosure. The unit should always be equipped with an exhaust silencer.

The unit is direct driven and has minimal service requirements (lubrication interval 10000 hours).

V	Hz	Motor	Part No
400	50	30 kW	112300
230	50	30 kW	112302
460 USA/CAN	60	40 hp	112304
600 CAN	60	40 hp	112306

RAF 2503

Pressure generation is achieved through two series connected stages. The unit is equipped with vibration isolation and a silenced enclosure. The unit should always be equipped with an exhaust silencer. The unit is direct driven and has minimal service requirements (lubrication interval 10000 hours).

RAF 2503 develops a maximum negative pressure of 20 kPa. Note though that the maximum airflow is 2800 m³/h. Above this, the power consumption would be too large for the 30 kW motor, so the design of the system must throttle to this level for all cases.

Measuring Tube

Dustcontrol's measuring tube is an easy and fast tool for the service engineer to carry out a control measurement – before and after installing the central vacuum system. The tube measures the air flow Q (m³/h) when the system is open, leakage flow and negative pressure when the system is closed. The measuring tube is placed between the filter and the vacuum producers, see graphic.

The measuring tube is included as a standard part in central vacuum systems from Dustcontrol's and can also be added to existing systems. Air flow meter is not included.

Fan Silencers for RAF 1600/2503

In order to decrease the noise level of our fans, RAF 1600 and RAF 2503, an in-line silencer must be installed on the exhaust duct. But you can fit one to the inlet as well, if required.

Several examples are illustrated of how noise level measurements can be affected. It is not unusual to obtain measurements of up to 110–120 dB(A) in completely non-silenced installations.
